
Instructions for translators of language resource files from 52RETAIL Web POS UI Designer:

- The domain of the translation is software user interfaces for people who operate tills in shops, supermarkets, etc.
- The file to translate is in JSON format (file extension .json) and contains key-value pairs.
- Only translate the values (located after the colons, and inside quotation marks), not the keys before the colons.

In the following example, values are highlighted and underlined:

```
"Login": {  
  "ConnectHeading": "Please connect to system",  
  "ConnectButtonText": "Connect",  
  "EnterCashierAndPassword": "Please enter cashier number and password to log in",  
  "EnterPassword": "Please enter password to log in",  
},
```

- Occasionally, values may contain variables, typically in curly brackets. Don't translate such variables; only translate the value wording around the variable. In the following example, a variable is highlighted and underlined:

```
"BackButtonText": "Back to {{name}}",
```

- When you save the translated JSON file, save it with a five-character language-region code as file name, for example de-DE.json for a German-language file for use in Germany or de-AT.json for a German-language file for use in Austria.
